The majority of the carcinogenic polycyclic aromatic hydrocarbons (PAHs) are formed during incomplete combustion of organic materials and have been shown to accumulate in the surrounding soil and sediments. The study was focused on the ability of Ligninolitici bacteria isolated from the Loess Plateau to biotransform PAHs. The study identified 11 strains with the ability to degrade at least one of the PAHs under investigation. The ability of bacteria to metabolize the PAHs was assessed by measuring changes in the PAH content of the incubation medium over time. The bacteria could be classified into three groups based on their capacity to biotransform the PAHs. The first group of bacteria could biotransform at least one and up to four PAHs, the second group biotransformed up to two PAHs, and the third group could only biotransform naphthalene. On the basis of the results of the study, a simplified version of the process of transformation of naphthalene to dihydrodiols was proposed. This study further revealed the need to assess the bioavailability of PAHs within the soil/sediments in order to understand their toxicity and the role of biotransformation by bacteria as an important first step in their potential transformation.National Day of Prayer The National Day of Prayer is an annual observance held on May 2 each year. The observance was first instituted in 1952 by the U.S. Congress. According to an explanation by the United States Senate, "Prayer Day is a day for all Americans to unite as a nation in our daily prayer. Prayer is an activity for all people. It is a way of affirming our beliefs in a higher power and the existence of a Creator. As a nation, we recognize that there are those whose beliefs and convictions differ from our own. However, as Americans we also understand that we are all part of a greater religious community, a family in which people share the same belief in and reverence for the God of our founders."
