AutoLISP AutoLISP is an extension language for AutoCAD R12 and later. AutoLISP allows programmers to develop customized graphical applications, utilities, and operators for AutoCAD. As a dynamic programming language, AutoLISP works without the need of compiling. It is similar to Visual Basic in that it is a combination of declarative and procedural programming. Programming in AutoLISP is more dynamic than the AutoLISP version in the earlier versions of AutoCAD and, therefore, many programmers prefer the newer versions. Many of the functions in AutoLISP can be accessed from Visual LISP. Although, there are some problems when accessing a Visual LISP from AutoLISP, which include: Problems with the length of strings. Problems with the order in which the arguments are stored. Problems when operating on some specific types of numbers, such as Date, Percentage, Float, or Decimal. The ability to access the DirectDraw interface functions. The ability to control other applications and APIs such as the Windows API. Some of the functions and routines that can be called from AutoLISP are listed below: Add procedure, adds two arguments and returns the sum. AddRectangles procedure, adds a list of Rectangles. ArcConnected procedure, adds a Rectangle and one or two points. ArcProcedure, adds an Arc. BinarySearch procedure, searches for a value in a sorted list. BlockName procedure, finds out the block name for a specified point. Coordinate procedure, finds the x,y coordinates of a point. CreateCube procedure, adds a cube at a point. CreateEllipse procedure, adds an Ellipse at a point. CreateLine procedure, adds a line from a point to another. CreateNamedBlock procedure, creates a named block. CreatePoint procedure, adds a Point at a specified point. CreateRectangle procedure, adds a Rectangle at a specified point. CurrentParameter procedure, finds out the current parameter in the command line. DataDefinedNames procedure, gets the data-defined names of a block. Drosophila ion channels: basic principles and functional implications. A new paradigm in physiology is emerging that highlights ion channels as the key regulators of cellular functions. Ion channels are critical regulators of electrical and chemical communication and are now recognized to form the molecular foundation of electrical signaling pathways. The new Drosophila Genomics Resource Center contains 22 Drosophila ion channel genes. These channels are expressed in all major organ systems, including the nervous, endocrine, immune, and musculoskeletal systems. The diversity of these channels permits the in vitro manipulation of fly ion channels, allowing in vivo testing of the functions of these ion channels in diverse cells and tissues. These channels are conserved in other organisms, and in Drosophila, most of the channel functions have been characterized. These studies have demonstrated a role for these channels in the control of electrical signaling and in the generation of cellular rhythms. A notable exception is a Drosophila channel, CG8423 (Hv1), which appears to function as a mechanosensitive ion channel in the tracheal system.
