Smart Home Split How to decrypt a password in Linux 2018/06/24 02:49 For thousands of years, humans have always been fascinated with the infinite possibilities that lie within mystery, like cryptography. The soul of what makes a man successful is not just intelligence, but an acute need to solve problems and take charge. This is exactly where cryptography comes in handy. This field is also referred to as information security, digital security, and even steganography. It is basically the science of encoding, analyzing, and decoding of information. Cryptography also provides a layer of protection to us from the many ways the information can be accessed and misused. So, in this post, we will explore how to decode passwords in Linux. Overview of cryptography

Cryptography is the science of encoding and decoding information. Basically, it uses algorithms (steps) that are based on the structure of the data. Because of the inability to know the exact algorithms, it is difficult to break the encryption. Cryptographic techniques: Insecurity is like a ticking time bomb that keeps exploding, as soon as you fail to stop the progress of an algorithm. Cryptography aims to help us tackle this vulnerability by using mathematical algorithms that are made up of very difficult math. The nature of the problem that the algorithm solves and how it is used determines the security level, which we use to determine the category of security in cryptography. There are mainly three categories of cryptography; asymmetric cryptography, symmetric cryptography, and public key cryptography. Symmetric cryptography: Symmetric cryptography uses the same algorithms

---

to encrypt and decrypt the messages. This is the most common and most widely used form of cryptography. Since the keys are derived from the same algorithm, they are the same, and they are known as symmetric keys. Asymmetric cryptography: Asymmetric cryptography is used when we need to exchange two keys to encrypt the messages. Basically, the recipient of the information needs to be able to decrypt it only. It is different from symmetric cryptography in the sense that the sender and receiver need to use different algorithms to encrypt the information. Asymmetric cryptography is also referred to as public key cryptography.

Conclusion From the above introduction, we have known that cryptography is essentially a science that deals with information and information security, which in turn involves various types of mathematical problems. The need for cryptography and security on the Internet is huge because of the possible misuse of information by different parties. Cryptography, and
