An emerging selective antagonist for the κ -opioid receptor generates synapses and silences neuronal network activity in *Drosophila*. We examined the role of the neurotransmitter-driven κ -opioid receptor on the formation and function of synapses in the olfactory circuit of *Drosophila*. These studies revealed that when locally released by the olfactory epithelium, κ -opioid receptor activation produces synaptic increases that decline over time. In contrast, κ -opioid receptor activity delivered at the periphery via local odorant exposure enhances synapses in a temporally-extended manner. Importantly, κ -opioid receptor activity is needed during synapse formation; disruption of κ -opioid receptor activity at the time of synapse formation halts synapse formation but has little effect on synapse consolidation. Consistent with this observation, κ -opioid receptor activity is required for the full power and scope of the firing of the odor-evoked neural activity (odor-evoked spontaneous activity) and the largest and least frequency components of spontaneous activity in the antennal lobe (the sharp wave-pause rhythm) in vivo. Thus, in contrast to its established role as an analgesic, κ -opioid receptor activity strongly promotes the formation of synapses and consequently enhances the
